all measured exons (n = 6,000)
tumour vs normal, top (n = 1,281)
cancer type, top (n = 1,914)
length divisible by 3
exact GENCODE exon
protein-coding exon
(of exact GENCODE exons)
overlaps a Pfam/CDD domain
(of fully coding exons)
overlaps a disordered region
(of fully coding exons)
overlaps a TM helix
(of fully coding exons)
